System Overview

PacerMan™ is the only high-fidelity simulator for immersive transvenous pacing—from needle insertion to capture using all the clinical equipment. The system offers a one of a kind opportunity to practice the entire procedure—including identifying intrinsic bradycardias, assessing intracardiac waveforms and manipulating output and rate with a pacing generator.

**SKILL DEVELOPMENT**

- Learn to manipulate the pacing generator and interact with your procedural kit.
  - Gain and lose capture
  - Refine output and rate in real-time
- Improve procedural performance through instructor led competencies and self directed repetition.
- Practice decision making based on outcome options.
- Train using blind and ECG guided techniques.
- Increase team engagement with scenario based learning.

**COMPONENTS AND ACCESSORIES**

- Body Form
- Replaceable Tissue
- Head Cover
- Torso Cover
- Fluid Reservoir Cap
- Vessel Channel Cover
- Simulated Extension System
- Body Form to USB Cable
- Wall Power Supply
- Battery Charger
- Battery Pack
- OEM Extension Cable
- Universal Extension Cable
- Drain Tube with Stop Clip
- Venous Fluid Mixing Bottle
- SimuSensor Venous Blood Concentrate
- Simulated Arterial Blood
- Fill Port with Funnel
- Arterial Hand Pump
- Fill Line
- Carrying Case

PacerMan requires your own pacing generator and kit.

REPLACEABLE TISSUE

Arterial Line

Venous Line

PACERMAN SOFTWARE

FLUID ACCESSORIES

1 Simulated Arterial Blood
2 SimuSensor Venous Blood Concentrate
3 Venous Fluid Mixing Bottle
4 Fill Port with Funnel
5 Drain Tube with Stop Clip
6 Arterial Hand Pump
7 Fill line
Quick Start Guide

1. Load the PacerMan software onto your PC or laptop.

2. Insert the replaceable tissue and fill up the fluid reservoir.

3. Connect body form to computer and power source.

4. Connect the body form to the pacing generator using the Simulated Extension System.

5. Turn on power switch, and then turn the valve to the IN USE position.

7. Choose Instructor or Student Mode.

8. If using Instructor Mode, set scenario parameters and then click begin.

9. You’ll hear the system self-calibrate and the status window will close, opening the monitor page.

   **NOTE:** If any status items display “NO” check your connection or see System Callibration on page: 21.

10. Turn on the vitals you want to present by toggling to the “ON” position

    Your PacerMan System is ready to go.
System Set Up

Make sure your computer has an Internet connection. The software requires USB and Bluetooth drivers to be installed when you use the PacerMan System for the first time.

REQUIREMENTS FOR SOFTWARE INSTALLATION

- Window 7 or higher
- 512 MB RAM
- Disk Space required if .net 4.5 is not already installed. If it is already installed, then it requires less than 2MB of disk space

**IMPORTANT NOTE:** Install the PacerMan Software on your PC before connecting the PacerMan System Body Form to your computer.

1 INSTALL SOFTWARE

The “Welcome” screen will automatically display when you insert the PacerMan set up CD.
Install Software (continued)

Select the destination folder for installation. Choose the default location or navigate to the desired location. Then click “Next”.

Click “Next” and proceed with the software installation.

Software installation will begin. Note: if you click “Cancel” on this screen it will end the installation.

Once your software is successfully installed, the “Installation Complete” screen will appear. Click “Close” and now the PacerMan set-up CD can be removed from the disk drive. Please restart your computer before proceeding.
2 Set up Bluetooth Connection

Ensure your PC is connected to the Internet the first time you connect to Bluetooth so the Bluetooth device driver can be properly installed. This will happen automatically in the background when the system is first paired.

To make PacerMan Bluetooth discoverable:

- Connect to wall or battery power
- Turn Power Switch ON
- Disconnect USB to Body Form Cable

Each PacerMan has a serial number that is a unique identifier and will be displayed in the discoverable device name. The Serial number can be found on a label under the PacerMan body form cover.

The PacerMan and PC will usually automatically connect anytime the two devices are in range of each other when the Body Form is turned on, and the USB cord is not connected to the body form.

Connection may take up to 30 seconds after PacerMan has been turned on and discoverable.

NOTE: If using multiple PacerMan Systems in the same room, make sure to properly pair each individual PC with the intended PacerMan body form serial number.
In Windows 7

1. Turn on your PacerMan System

2. Select the Windows Start button > Devices and Printers.

3. Select Add a device > select the PacerMan > Next.

4. Follow any other instructions that might appear.

In Windows 8.1

1. Turn on your PacerMan System

2. Select the Start button > type Bluetooth > select Bluetooth settings from the list.

3. Turn on Bluetooth > select the PacerMan > Pair.

4. Follow any instructions that might appear.
3 **UNPACK AND INSPECT**

Check to make sure all of the parts listed in the System Components section are in the case. Contact Simulab for assistance if anything is missing or damaged.

4 **INSTALL TISSUE**

Remove the torso and head covers from the body form. Then take off the black vessel channel cover by using the finger clips to gently lift off.

Place the replacement tissue in the cradle, and lay the venous line into the channel.
Install Tissue (continued)

Connect the tissue in the two places shown. Make sure it’s snapped securely into both ends.

Replace the vessel channel cover, ensuring it snaps into place.

Lay the arterial line into the channel in the head area and replace the head cover.
Install Tissue (continued)

To create an arterial pulse, attach the pulse bulb to the artery (red line). It is pre-filled with red simulated blood. If air gets into the pulse bulb, you’ll need to refill it. Please see “Refilling the Pulse Bulb” on page 28. NOTE: When removing the pulse bulb, do so over a paper towel, as there will be a small release of fluid.

5 PREPARE FLUID SYSTEM

Mix SimuSensor Venous Concentrate (blue) with water in the Fluid Mixing Container by following these steps:

**MIXING RECIPE:**

1. Fill water up to the 30 oz line

2. Add 2 oz of the Blue SimuSensor Venous Concentrate up to top line.

3. Shake to mix.

Fill up the fluid reservoir using the funnel and be sure to keep an eye on the fluid level. Then replace the reservoir cap.

**NOTE:** The fluid reservoir holds approximately 24 oz when it’s empty.
Prepare Fluid System (continued)

Replace the head and torso cover.

6 CONNECT TO POWER

PacerMan is powered by battery or wall power. To connect the battery, place it in the battery well that’s located under the torso cover.

Put the torso cover back on and the cord will fit through the mouse hole as shown. Plug the battery cord into the port labeled DC IN on the panel.

For wall power, plug the Wall Power Supply into the DC IN port and plug the other end into the wall.

Then turn the power switch on and turn the Valve to the IN USE position.

**NOTE:**

The System requires the valve to be in the “In Use” position while using the System.

PacerMan System
7 **BODY FORM TO PC**

Connect PacerMan with your computer using the Body Form to USB cable. Simply plug one end into the port labeled “USB” and the other end into your laptop or PC. Or use Bluetooth connection.

8 **CONNECT PACERMAN TO YOUR PACING GENERATOR**

The Simulated Extension System connects your pacing generator with the PacerMan Body Form. It has one cable to fit most Medtronic pacing generators and another universal cable for those with only distal and proximal plug-ins.
System Set-up Checklist

☐ **Tissue:** Ensure tissue is connected properly. See “Install Tissue” on page: 12.

☐ **Fluid:** Ensure tank is filled. See “Prepare Fluid System” page: 14.

☐ **Extension System:** Ensure the Extension System is connected. See “Connect PacerMan to your Pacing Generator” on page: 16.
PacerMan Software Guide

1 LAUNCHING PACERMAN SOFTWARE

The first time you connect the PacerMan body form to the PC a driver will install. This requires a connection to the Internet and will happen in the background.

Launch the PacerMan software by double-clicking on your desktop icon through the Start Menu, or in the directory where your software was installed.

The PacerMan System Home Page will open and you will be ready to begin.
From the home page, choose to operate PacerMan in the Instructor Mode or Student Mode.

1 **Instructor Mode**: Allows you to select a scenario set up by choosing multiple outcomes for transvenous or transcutaneous pacing (see page 20).

2 **Student Mode**: Automatically initiates a unique scenario to allow for independent learning.

3 **User Support**: The User Support Section contains links providing help with troubleshooting, how to contact the Simulab Customer Care team and specifics about your PacerMan Software version.

4 **System Power Indicator**: This indicator will alert you to the system power status.
Next, the system will prompt you to set up your scenario parameters.

1. **Intrinsic Cardiac Rhythm**: Choose an option from the dropdown menu.

2. **Transcutaneous Settings**: (Optional) Choose successful capture threshold and outcome settings. *Note: keeping the default settings will not have an impact on the scenario.*

3. **Transvenous Pacing Settings**:
   - **Capture Threshold**: Decide what a successful mA output will be to gain capture.
   - **Outcome**: What outcome will the first pass of the catheter present?

4. **Click** Begin. The system will calibrate and the monitor screen will open.
Calibration

Calibration starts when you choose Instructor or Student Mode and press begin. It automatically checks your system status and primes the tissue fluid system. If any status items respond with “No”, you’ll need to check to see if the item was installed correctly.

Calibration Troubleshooting

1. If “Tissue Installed” says no go to page: 12.
2. If “Fluid Filled” says no go to page: 14.
3. If “Accessory Connected” says no go to page: 16.
Next, the Monitor Page will open. Choose your vital options and monitor views.

**Monitor Page Guide**

1. **Patient Monitor**
2. **New Scenario and Home Buttons**
3. **Transcutaneous Pacing Panel**
4. **Patient Vitals:**
   - Heart Rate, Arterial Blood Pressure, SpO\(^2\), NIBP
5. **Additional Functionality Bar:**
   - Sound, Extended Patient Monitor, Intracardiac ECG Tracing
Monitor Page (continued)

**PATIENT VITALS**

To turn on the individual patient vitals move the toggle to the “ON” position.

<table>
<thead>
<tr>
<th>Heart Rate</th>
<th>Arterial Blood Pressure</th>
<th>SpO²</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>OFF</td>
<td>OFF</td>
</tr>
</tbody>
</table>

**Heart Rate:** Will present the patient heart rhythm.

**Arterial Blood Pressure:** Will display the pressure waveform and reading.

**SpO²:** Will display the pressure waveform and reading.

**NIBP Start Button:** The NIBP Start Button will simulate an inflation of the blood pressure cuff. The reading will match patient state, and adjust when recycled.

**NEW SCENARIO**

After each student training, remove the pacing lead from the body form and press the New Scenario button. This brings you to the Scenario setup window and allows the instructor to reset the scenario parameters.

Press the Home button to return to the home page.

**NOTE:** Ensure the pacing lead is not in the system when you start a new scenario.
Monitor Page (continued)

**ADDITIONAL FUNCTIONALITY BAR**

**Sound:** Turn on the sound toggle to enable sound functionality.

**Extended Patient Monitor:** Allows for the extension of the patient monitor to a second monitor when toggled “ON”. To properly extend the screen to a second monitor in your PC. Go to Control Panel » Display » Screen Resolution or Screen Appearance and set to “Extend this display”.

**Intracardiac ECG Tracing Toggle:** The PacerMan software will display an Intracardiac ECG Tracing on the Monitor Page. The ECG tracing responds to proper clinical interaction with the pacing catheter pins and extension system. Click the toggle to “ON” to open.

**NOTE:** To view ECG data the distal (-) pin must be removed from the Simulated Extension System, and the proximal (+) pin inserted into the proximal port. This will simulate connecting the distal pin to the ECG machine with the alligator clip.
Monitor Page (continued)

**DEFIBRILLATOR INTERFACE OPTIONS**

Using the scroll buttons, choose from two defibrillator pacing panel options that approximate two major brands.

If you choose Transcutaneous Pacing, you’ll see the Main Interface Page will open and display the patient monitor with a simulated defibrillator window.
Choose Your Procedural Option:

☐ Transcutaneous Pacing

☐ Blind Approach

☐ ECG-Guided Approach
Maintenance and Storage

**1 BATTERY CHARGING**

Plug Battery pack into battery charger. Then plug the battery charger into the wall.

A red indicator light means it’s still charging, and a green light means the battery is fully charged.

**2 REFILLING THE PULSE BULB**

To refill the pulse bulb, connect the fill line to the bulb and slowly add more red fluid.
Refilling the Pulse Bulb (continued)

Gently squeeze the pulse bulb to add fluid. When the bulb will not take any more fluid and all air bubbles have risen, disconnect the fill. Pour remaining fluid back into the bottle.

The pulse bulb can then be reconnected to the vessel.

The body form is now ready for use.

3 DRAINING THE SYSTEM

Drain the system for storage whenever the system will not be used for over 24 hours.

Attach the drain tube to the drain port on the Power and Drain Interface Panel; make sure the clamp is closed.

NOTE: Insert the drain tube into the mixing container, relock clamp and remove drain tube.
Draining the System (continued)

Turn the In Use Valve counterclockwise as demonstrated.

Place the mixing container under the drain line and release the clamp; the system will fully drain.

Finally, remove the drain line; seal the mixing container for storage.

4 **POWER DOWN THE SYSTEM**

Turn System Power button to the “OFF” position and disconnect from battery or wall power.
Power Down the System (continued)

Turn the In-Use Valve back to the “IN-USE” position.

---

5 CLEANING THE SYSTEM

Take head and torso cover off and thoroughly clean with rubbing alcohol, especially where fluid pools near connection ports to prevent staining.

---

6 PACKING AND STORING

To store the system, check to make sure all the system components are in the carrying case.

When repacking the body form, make sure the base is positioned opposite from the case’s handle. This protects the body form’s electronics from damage.
Packing and Storing (continued)

Store replaceable tissues in a plastic zip lock bag. This will contain any excess fluid released and prevent evaporation of fluid.
# Troubleshooting

## SYSTEM SETUP

<table>

Maintenance and Support Agreement

WARRANTY

Simulab is pleased to offer a 30-day money back guarantee on the PacerMan™ System and Replaceable Tissue. If for any reason, within the first 30 days of receipt of PacerMan, you are not satisfied with your purchase, please contact your Sales Representative to return the System.

With your purchase, you are also eligible for a 90-day warranty and a maintenance agreement, which are both outlined below. If you have any questions, please contact Customer Service or your Sales Representative at 206-297-1260 or 866-400-1260.

90-DAY WARRANTY

Simulab offers a 90-day warranty on all parts of the PacerMan System assuming reasonable wear and tear with the exception of any used replaceable tissues. For warranty claims, please contact Customer Service for an RMA request and ship the part or entire system back to Simulab Corporation for replacement or refurbishment.

The customer is responsible for freight costs back to Simulab and Simulab will pay return shipment to the customer.

WARRANTY DISCLAIMER

The PacerMan System should be shipped in its original packaging or an equivalent box and its soft-sided carrying case with foam. Shipping PacerMan in the soft sided bag only is not advised, and may void the maintenance agreement. For annual refurbishment, Simulab will provide to the customer a shipping box at no charge.
MAINTENANCE AND SUPPORT AGREEMENT

The maintenance and support program allows for repair of any part of your PacerMan System, should it break with the exception of the replaceable tissue. It also covers software support and updates. This agreement does not cover any lost parts or accessories nor does it cover damage outside normal wear and tear.

If any portion of the system is showing wear and tear, Simulab will refurbish it annually as a part of this program. Refurbishment under this agreement will be completed at Simulab’ s facility in Seattle, Washington, USA at the customer’s request.

ANNUAL REFURBISHMENT (INITIATED BY CUSTOMER)

To receive system refurbishment, please contact Customer Service for an RMA number. Customer Service will also provide instructions on how and what to return to initiate this process.

Production time is four weeks upon receipt of materials. Expedited freight is available upon request and a quote will be provided. The customer is responsible for all freight costs associated with replacement or refurbishment.

Simulab will refurbish the system to as close to “like new” condition as possible. If a component cannot be repaired due to damage outside of normal wear and tear, Simulab will contact the customer with available options.
